

Seminar on Condensed Matter Theory

Group of Theoretical Physics at the Department of Condensed Matter Physics
of Charles University has a pleasure to invite you to attend the seminar

on 6 December 2018 at 13:00

at Faculty of Mathematics and Physics of Charles University, Ke Karlovu 5, 121 16 Praha 2

Seminar room F052

Mgr. Martin Friák, Ph.D.

*Academy of Sciences of the Czech Republic, Institute of Physics, Electrical and Magnetic
Properties Group, Žitkova 22, Brno*

Nano-to-meso scale study of mechanical properties of Fe-Al-based superalloys

Fe-Al-based ferritic superalloy nanocomposites containing sub-micron cuboids of intermetallic phases coherently embedded into a disordered Fe-Al solid solution are intensively studied as candidate materials for high-temperature applications. We focused on Fe-Al-based superalloys containing Ti [1,2] and Co [3] as ternary elements as well as Fe-Al binary nanocomposites [4]. The transmission electron microscopy (TEM) revealed a superalloy nano-structure in these materials and the energy-dispersive X-ray (EDX) technique detected the composition of individual phases. Subsequently, quantum-mechanical calculations were used to determine thermodynamic, elastic and magnetic properties of constituting phases as well as selected nanocomposites [4]. In particular, the theoretically predicted significant differences in the elastic response of different phases were confirmed also experimentally by room-temperature quasistatic nano-/micro-indentation and nano-scale dynamic mechanical analysis (nanoDMA). Regarding high-temperature macro-scale measurements, small-punch testing was performed and showed improved creep properties of the studied materials when compared with binary Fe-Al.
